

# 淡江大學 100 學年度轉學生招生考試試題

本試題雙面印刷

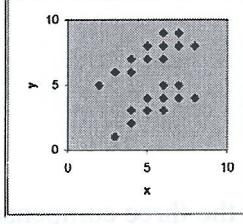

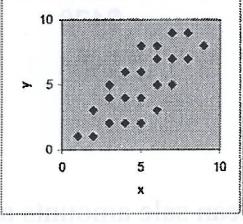

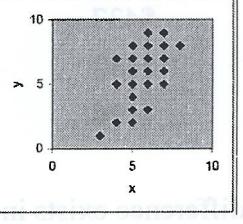

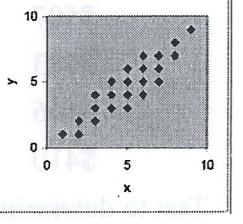

系別：統計學系三年級

科目：統計學 64-1

考試日期：7月19日(星期二) 第1節

本試題共 2 大題， 3 頁

一、Multiple choice: please choose one answer from those answers (18 %)

- Which of the following statements is not a property of the normal curve?  
 A) bell shaped      B)  $P(\mu - \sigma < X < \mu + \sigma) \approx 0.95$   
 C)  $\frac{IQR}{\sigma} \approx 1.3$       D) The normal probability plot will produce close to a straight line
- I want to test  $H_0: \mu = 15$  vs.  $H_a: \mu \neq 15$  using a test of hypothesis. If I concluded that  $\mu$  is 15 when, in fact, the true value of  $\mu$  is not 15, then I have made a \_\_\_\_\_.  
 A) Type I error      B) Type II error      C) correct decision      D) Type I and Type II error
- If a least squares line were determined for the data set in each scatter plot, which would have the smallest variance?  
 A)  B)  C)  D) 

二、Answer the following questions

- State the four basic assumptions about the general form of the probability distribution of the random error  $\epsilon$  in the linear regression model. (8 %)
- Independent random samples, each containing 500 observations were selected from two binomial populations. The samples from populations 1 and 2 produced 210 and 320 successes, respectively. Test  $H_0: p_1 \geq p_2$  against  $H_a: p_1 < p_2$ . Use  $\alpha = 0.05$ . (16 %)
- A new weight-reducing technique is tested before its introduction into the market. The weights of a random sample of five people are recorded before they are introduced to this diet. The five individuals are then instructed to follow the diet for 3 weeks. At the end of this period, their weights (in pounds) are again recorded. The results are:

Person	Weight Before Diet	Weight After Diet
1	156	149
2	201	196
3	194	191
4	203	197
5	210	206

64-2

考試日期：7月19日(星期二) 第1節

本試題共 2 大題， 3 頁

Test to determine if this diet is effective at reducing weight. Use  $\alpha = 0.10$ . (16 %)

- A random sample of 250 students at a university finds that these students take a mean of 14.7 credit hours per quarter with a standard deviation of 2.2 credit hours. Find the 95% confidence interval for the mean credit hours taken by a student each quarter. (12 %)
- A company that employs a large number of salespeople is interested in learning which of the salespeople sell the most: those strictly on commission, those with a fixed salary, or those with a reduced fixed salary plus a commission. The previous month's records for a sample of salespeople are inspected and the amount of sales (in dollars) is recorded for each, as shown in the table. (30 %)

Commissioned	Fixed Salary	Commission Plus Salary
\$507	\$450	\$425
\$492	\$418	\$492
\$507	\$437	\$470
\$483	\$432	\$506
\$466	\$444	
\$410		

Test to determine if a difference exists in the mean sale amounts among the three compensation systems. Test using  $\alpha = 0.025$ .
