- Consider two spherical conductors with radii b_1 and b_2 ($b_2 > b_1$) that are connected by a conducting wire. The distance of separation between the conductors is assumed to be very large in comparison to b_2 so that charges on the spherical conductors may be considered as uniformly distributed. A total charge Q is deposited on the spheres. Find (a) the charges on the two spheres, and (b) the electric field intensities at the sphere surface. (20%)
- 二、A cylinder capacitor consists of an inner conductor of radius a and an outer conductor whose inner radius is b . The space between the conductors is filled with a dielectric of permittivity ϵ , and the length of the capacitor is L . Determine the capacitance of this capacitor. (20%)
- 三、An infinitely long, straight conductor with a circular cross section of radius b carries a steady current I . Determine the magnetic flux density both inside and outside the conductor. (20%)

- 四. A sinusoidal electric intensity of amplitude $250(\text{V/m})$ and frequency $1(\text{GHz})$ exists in a lossy dielectric medium that has a relative permittivity of 2.5 and a loss tangent of 0.001. Find the average power dissipated in the medium per cube meter. (20%)
- 五. A y-polarized uniform plane wave (E_i, H_i) with a frequency $100(\text{MHz})$ propagates in air in the x direction and impinges normally on a perfectly conducting plane at $x=0$. Assuming the amplitude of E_i to be $6(\text{mV/m})$, write the phasor and instantaneous expressions for (a) E_i and H_i of the incident wave; (b) E and H of the total wave in air.

(20%)
